## TABLE OF CONTENTS

<b>Chapter 1</b>	General introduction, aims and outline of this thesis
<b>Part I</b>	<b>Optimizing motor function measures: towards video-based clinical assessment</b>
<b>Chapter 2</b>	Assessment of multiple aspects of upper extremity function independent from ambulation in multiple sclerosis enhances disability assessment.
<b>Chapter 3</b>	Video-based pairwise comparison: enabling the development of automated rating of motor dysfunction in multiple sclerosis.
<b>Part II</b>	<b>Optimizing cognition measures: towards a reliable clinical screening tool</b>
<b>Chapter 4</b>	Comparing long term results of PASAT and SDMT scores in relation to neuropsychological testing in Multiple Sclerosis.
<b>Chapter 5</b>	Regression-based norms for the Symbol Digit Modalities Test in the Dutch population: improving detection of cognitive impairment in multiple sclerosis?
<b>Part III</b>	<b>Optimizing imaging measures: towards accurate deep grey matter segmentation</b>
<b>Chapter 6</b>	Development and evaluation of a manual segmentation protocol for deep grey matter in multiple sclerosis: towards accelerated semi-automated references.
<b>Chapter 7</b>	Reduced accuracy of MRI deep grey matter segmentation in multiple sclerosis: An evaluation of four automated methods against manual reference segmentations in a multi-center cohort.
<b>Chapter 8</b>	Manual and automated tissue segmentation confirm the impact of thalamic atrophy on cognition in Multiple Sclerosis: a Multicenter study.
<b>Chapter 9</b>	Summary, general discussion and future perspectives
