Abstract 15

1. Introduction 17
   1.1 Research motivation & objectives 18
   1.2 Research questions 20
   1.3 Research design 20
      1.3.1 The research project and concept of Living Labs 20
      1.3.2 The e3-control methodology 23
      1.3.3 Research approach 25
      1.3.4 Data collection 28
   1.4 Research contribution 29
   1.5 Thesis structure 31
   1.6 Publications overview 33

Part I: IT enabled control procedure redesign 37
2. E3-control: A redesign methodology for control procedures 38
   2.1 Introduction 38
   2.2 The e3-control: In a nutshell 39
   2.3 A software support tool for control procedure redesign 42
      2.3.1 Value level modelling: The e3-value 42
      2.3.2 Process-level modelling: Utilizing Control Procedure Ontology (CPO) with UML template 46
   2.4 The e3-control application guideline 52
      2.4.1 Step 1: Value based preliminary analysis under AS-IS situation 53
      2.4.2 Step 2: Process level control problems identification 54
      2.4.3 Step 3: Process level control mechanism redesign 56
      2.4.4 Step 4: Value based network and redesign evaluation 56
   2.5 Application and case studies 57
      2.5.1 The Beer Living Lab 58
   2.6 Conclusions 71

3. Design and analysis of e-government control: The green corridor between Finland and Russia 73
   3.1 Introduction 73
   3.2 The e3-control: A modelling approach for designing controls 74
   3.3 Case study: The green corridor between Finland and Russia 74
      3.3.1 Step 1. Value perspective: Preliminary analysis 74
      3.3.2 Step 2. Process perspective: Applying the CPO approach to identify control problems 75
      3.3.3 Step 3. Process perspective: Applying the CPO approach to redesign control mechanisms 78
      3.3.4 Step 4. Value perspective: Evaluation 80
   3.4 Conclusions and future research 81

4. Designing e-Customs scenarios for food export: An application of the e3-control methodology 83
   4.1 Introduction 83
7.4.1 Moral hazard in Beer LL 129
7.4.2 Redesign Solution: Effective information sharing scheme with embedded IT-based control 133
7.4.3 Adverse selection 134
7.4.4 Recommendations 136
7.5 Conclusions and future research 136
8. Realizing collaborative government-to-business business models: The case of the authorized economic operator 139
8.1 Introduction 139
8.2 Asymmetric information problem in G2B relationship building 141
8.3 Case study of the AEO assessment in the Netherlands 143
8.3.1 Research methodology and process 144
8.3.2 Research findings 144
8.4 The business model and process for AEO risk management 147
8.5 Conclusions 153
9. Using trust and reputation in government-to-business relationships: The authorized economic operator (AEO) as an example 155
9.1 Introduction 155
9.2 Principle/agent problem between government and businesses: Transaction cost perspectives 157
9.2.1 Principal/agent problem between government and businesses 157
9.2.2 Transaction cost perspectives 158
9.3 Role of trust and reputation in G2B relationships 160
9.3.1 The fundamental problem of exchange and the game of trust 160
9.3.2 Using reputation in solving the game of trust 165
9.3.3 Different solutions to the game of trust: Control based vs. trust based governance approach 166
9.3.4 Comparison of transaction cost: Control based vs. trust based regulation 169
9.4 The case of AEO 171
9.4.1 Authorised Economic Operator (AEO): What, how and why 171
9.4.2 Case study: AEO certificate assessment in the Netherlands 173
9.5 Policy recommendations: More government involvement in enhancing the reputation effect of the AEO 181
9.6 Conclusions 182
10.1 Introduction 185
10.2 Review of value understanding in private and public domains 187
10.2.1 Value in private sector 187
10.2.2 Value in the public sector 189
10.2.3 Bridging the gap of value assessment between private and public sectors 193
10.3 Research method and case background 195
