Acknowledgements

I have been around for a while, at the Biophysics of Photosynthesis group, but also at the Vrije Universiteit Amsterdam, and I have met some wonderful people over the years. Some I have worked with directly, others I have only ever advised on topics of data analysis or IT and some I have just had the pleasant fortune of socializing with from time to time. I would like to thank and mention every single one of you, but I inadvertently will forget someone or run out of space. That doesn’t mean that I am not grateful, but it means a chat while enjoying a nice cup of coffee – or tea – is long overdue!

First and foremost I need to thank my mentor and daily supervisor, Ivo, who gave me all the freedom to develop myself as a scientist but was always there for questions and support. I greatly appreciate your enthusiasm for science, data analysis in particular and for always sharing with me the latest and greatest results of your projects. It really was a pleasure sharing an office with you all these years and despite this thesis signaling the end of my PhD, I’m glad we have a bit more time to create something great together.

Then Rienk, my promotor, who if possible allowed me for even more freedom, yet was always available for crucial guidance when needed. Interacting with you was easy, I just needed to wait until your coffee ran out and would soon find you in my office for a refill. Thanks for all the beans! Apart from enjoying coffee, there were some other things we did together. Remember organizing the course “How To Survive 2050?”, now more relevant than ever I would say. And being able to travel to Jodhpur, India as your university fellow is an experience I will never forget.

Alonso, with whom I also shared an office for many years, thank you for allowing me to meddle in your projects when I needed a break from my own. I hope I was of some help, at least it resulted in some nice publications together, with hopefully a few more to come. But really, thank you also for just being a good friend and great listener.

My thanks to all my collaborators over the years with whom I spend a considerable amount of time discussing manuscripts, data, analysis thereof and results. And results there have been, for that I only need to refer the reader to the publication list attached to this thesis.

Specifically, I want to thank a few of these people. First Lucy, whose data I used in some of my key publications. You spend many days and nights in dark rooms preparing and cooling
down samples in order to bombard them with lasers, I appreciate that. Margherita, thank you too for the beautiful experimental data you provided me with. Sergey, we have quite some publications together, most notably of course our Glotaran paper. But thank you also for helping me to finish the enormously laborious luciferin project, which ultimately led to a very nice publication in a very prestigious journal. Hopefully, we can continue our collaboration on the development of Glotaran for many years to come.

Kate, you, together with Ivo, are one of those proverbial giants I had the fortune to be able to stand on the shoulders of. Glotaran would not have been possible without TIMP. Ralf, you brought the glue to the table that made the Framework possible, thank you for that. And thank you for teaching me how to make a proper cappuccino and showing me around Wurzburg. Joern and Stefan, although you joined the Glotaran team more recently, thank you for the effort you put in already. Together we will make Glotaran 2 the most useful piece of equipment in the experimentalists’ toolbox for a long time to come.

Bart and Lijin, thank you both for always being around for questions and interesting experimental, technical and theoretical discussions. Janneke, thank you for the template for this thesis but also for being a pleasant colleague to talk to commuting back and forth to Leiden for many years. And the same goes out to Onno and Niels in that regard.

John, Raoul, Jan, Marloes and Roberta, thank you for contributing to a pleasant and highly dynamic biophysics group over the years. And Roberta, thank you also for chairing my thesis committee, the members of which I would like to thank in advance for the time they have spent reading and evaluating my thesis.

Nikolay, thanks for letting me in on the dirty little secret of nutrition science, allowing me to discover the wonderful world of real science based nutrition, take charge and shed all the kilos I gained during my PhD, no effort. #lchf – look it up, thank me later! 😊

Piet, Gerrit, Jaap, John and Knud. Ik kon altijd aanschuiven voor een gezellige gesprek bij de lunch, bedankt! And all the colleagues and friends who contributed to my very enjoyable PhD but who I didn’t specifically mention here, thank you too.

Tot slot, Mam en Pap. Bedankt voor alle hulp in de afgelopen jaren, ik kon altijd rekenen op jullie steun, en dat betekent veel voor me. Saar, Lot dank voor jullie aanmoediging! 😊

Ninta, love of my life, no words could do justice to how important you have been, before and throughout my PhD, but I know you know. And Maeko, the joy you brought to your parents’ life is indescribable, but I know you don’t know, yet, but you will – or you will be able to read it here one day.
