Abstract	vii
Preface	ix
1 Introduction	1
1.1 Groundwater management in The Netherlands	1
1.2 Deforestation increases groundwater recharge?	2
1.3 The forest hydrology project 1994-1998	4
1.4 Research objectives and site selection	5
1.5 Outline of the thesis	6
2 Theory of forest evaporation	9
2.1 Introduction	9
2.2 Water balance of forests	9
2.2.1 Water balance above the soil surface	9
2.2.2 Water balance below the soil surface	10
2.3 The energy balance	12
2.3.1 Radiation balance	12
2.3.2 Energy storage fluxes in air and vegetation	12
2.3.3 Soil heat flux density	13
2.3.4 Energy balance of a forest	13
2.4 Turbulent fluxes of momentum, latent and sensible heat	14
2.4.1 Turbulent fluxes based on Reynolds averaging	14
2.4.2 Turbulent fluxes based on gradients	14
2.4.3 Turbulent transport using eddy diffusivities “K-theory”	15
2.5 Evaporation of a “dry” forest	16

2.5.1	“ <i>Big leaf</i> ” model	17
2.5.2	Aerodynamic resistance	18
2.5.3	Stomatal conductance	19
2.5.4	Root water uptake	21
2.5.5	“ <i>Dual source</i> ” model for two vegetation layers	23
2.6	Evaporation of a “wet” forest	25
2.6.1	Interception storage	26
2.6.2	Evaporation rate under wet conditions	26
2.6.3	Interception loss as a fraction of P	27
2.6.4	Interception loss as a function of storm intensity	27
2.6.5	Interception loss based on physical concepts	28
2.6.6	Effect roughness length for momentum and heat on E_i	30
2.6.7	Methods to derive interception loss and canopy storage	30
3	Characteristics of the research sites	35
3.1	Introduction	35
3.2	Methods being used	36
3.2.1	Vegetation characteristics	36
3.2.2	Soil physical characteristics	38
3.3	Bankenbos	39
3.4	Edesebos	43
3.5	Fleditebos	48
3.6	Kampina	54
3.7	Loobos	57
3.8	General differences between the sites	63
4	Hydro-meteorological measurements at the sites	65
4.1	Measurement campaigns	65
4.2	Edesebos site	67
4.3	Bankenbos, Fleditebos, Kampina and Loobos sites	69
4.3.1	Measurement set-up	69
4.3.2	Sensible and latent heat flux densities	70
4.3.3	Measuring transpiration by sap flow	72
4.3.4	Radiation	73
4.3.5	Soil heat flux density	73
4.3.6	Meteorological background variables: u , u_{dir} , α_r and T_a	74
4.3.7	Precipitation, throughfall and stemflow	74
4.3.8	Soil temperature and soil water	77
4.3.9	Groundwater level depth	79

4.3.10	Discharge	80
4.4	Main uncertainties in the hydro-meteorological measurements	80
5	Quality control of the flux measurements	81
5.1	Introduction	81
5.2	Roughness parameters and fetch conditions	82
5.2.1	Non-rotated fluxes	85
5.3	Power (co-)spectra of turbulent components	86
5.4	Energy balance closure	87
5.4.1	Heat storage in soil and litter layer	89
5.4.2	Heat storage in the biomass	90
5.4.3	Results energy balance closure	90
5.5	Data quality under wet conditions	93
5.6	Conclusions	94
6	Gap filling to generate continuous data sets	97
6.1	Introduction	97
6.1.1	Overview of methods to fill gaps in time series	98
6.2	Quality check and data gap filling procedure	99
6.2.1	Automatic Weather Station data	100
6.2.2	Flux data λE	101
6.2.3	Gap filling procedure	102
6.3	Artificial Neural Network as non-linear regressor	102
6.4	Results	104
6.4.1	Automatic weather station data	104
6.4.2	Gap filling λE	107
6.4.3	Effect of the number of missing records on uncertainty	111
6.5	Discussion	112
6.6	Conclusions	114
7	Dry canopy evaporation	115
7.1	Introduction	115
7.2	Leaf area development of undergrowth at Fleditebos and Loobos site	117
7.2.1	L_{AI} of the herbal undergrowth of the <i>poplar</i> forest	118
7.2.2	L_{AI} of the grass undergrowth of the <i>pine</i> forest	118
7.3	Root water uptake	118
7.3.1	Root water uptake parametrization	118
7.4	Methods used to derive surface conductance	121
7.4.1	“Big leaf” approach	122
7.4.2	Dual source model for two vegetation layers	122

7.4.3	Radiative transfer scheme for sparse canopies	122
7.4.4	Stomatal conductance parameter optimization	123
7.5	Stomatal conductance using the “big leaf” approach	123
7.5.1	Effect of parameter reduction on uncertainty	129
7.5.2	Stress from different soil water sources in the unsaturated zone	130
7.5.3	The effect of groundwater uptake by roots	133
7.5.4	Modelling soil water feedbacks from deeper soil layers	134
7.5.5	Seasonality in surface conductance parameters	137
7.6	Separating evaporation of trees and undergrowth	138
7.6.1	The eddy-decay coefficient for undergrowth	140
7.6.2	Radiative forcing	140
7.7	Surface conductance using the dual source approach	141
7.7.1	Evaluation of the <i>dual source</i> model	144
7.8	General discussion	147
7.9	Conclusions	152
8	Wet canopy evaporation	155
8.1	Introduction	155
8.2	Precipitation characteristics, number of showers per day	156
8.3	Evaporation rate of intercepted rain	157
8.3.1	Aerodynamic resistance	157
8.3.2	Evaporation rate of wet vegetation	160
8.4	Storage of intercepted precipitation	165
8.5	Verification of interception parametrization	170
8.5.1	Application of the interception parametrization to the Edesebos site	170
8.5.2	Effect of temporal variation in $\overline{E}/\overline{P}$ and water storage C . . .	172
8.6	Discussion	174
8.6.1	Evaporation rate	174
8.6.2	Storage capacity	177
8.7	Conclusions	180
9	Epilogue	183
9.1	Main conclusions	183
9.2	Deriving actual evaporation for forests in the Netherlands	185
9.3	Research perspectives	187
A	Stemflow	189
B	Weight fractions of the soil	191

C	Data processing for the eddy correlation technique	193
C.1	Oxygen absorption	194
C.2	Axis rotation	195
C.3	Frequency response corrections	196
C.4	Sensible heat flux and air temperature	200
C.5	Latent heat flux	200
D	Storage of heat in biomass	201
E	Soil water availability	205
F	Small scale spatial variability in storage capacity of intercepted water	207
	Summary	211
	Samenvatting	221
	Curriculum Vitae	231
	List of main symbols used	237
	List of Figures	243
	List of Tables	247
	Bibliography	251
