## List of Tables

3.1	Vegetation characteristics of the Bankenbos site . . . . .	40
3.2	Volume fractions and densities of the soil at the Bankenbos site . . . . .	42
3.3	Soil hydraulic parameters at the Bankenbos site . . . . .	43
3.4	Vegetation characteristics of the Edesebos site . . . . .	45
3.5	Volume fractions and densities of the soil at the Edesebos site . . . . .	46
3.6	Soil hydraulic parameters at the Edesebos site . . . . .	46
3.7	Vegetation characteristics at the Fleditebos site . . . . .	49
3.8	Volume fractions and densities of the soil at the Fleditebos site . . . . .	51
3.9	Soil hydraulic parameters at the Fleditebos site . . . . .	52
3.10	Vegetation characteristics at the Kampina site . . . . .	56
3.11	Volume fractions and densities of the soil at the Kampina site . . . . .	56
3.12	Soil hydraulic parameters at the Kampina site . . . . .	57
3.13	Vegetation characteristics at the Loobos site . . . . .	59
3.14	Volume fractions and densities of the soil at the Loobos site . . . . .	61
3.15	Soil hydraulic parameters at the Loobos site . . . . .	62
3.16	Total $L_{AI}$ and soil water holding capacity for the different sites . . . . .	63
4.1	Heights at which the different variables were measured . . . . .	66
4.2	Variables measured with their estimated field accuracy at the Edesebos site . . . . .	67
4.3	Variables measured with manufacturer provided and field accuracy at the sites Bankenbos, Fleditebos, Kampina and Loobos . . . . .	71
4.4	Groundwater level monitoring wells at the Bankenbos, Fleditebos, Kampina and Loobos sites . . . . .	79

5.1	Tree height, tower height, roughness length, displacement height and distance where the flux source is located . . . . .	86
5.2	Regression results of non-rotated versus rotated fluxes . . . . .	87
6.1	Neural network configurations for the gap filling of the automatic weather station variables . . . . .	105
6.2	Simulation of $\sigma T^4 - R_l^{down}$ by different neural network configurations	106
6.3	Total evaporation $E$ of 1996 at the Loobos site: “Best estimate”, NN trained for dry periods only, for wet periods only, and derived as residue of the water balance . . . . .	109
6.4	Total evaporation $E$ at the Loobos site with missing data filled using different filling techniques. . . . .	110
6.5	Percentage of missing data and uncertainty due to gap filling . . . . .	111
7.1	Optimized maximum surface conductance and stomatal conductance functions for each year and each site . . . . .	126
7.2	Optimized maximum surface conductance and stomatal conductance functions for the periods that the poplar trees or the undergrowth were dominantly active at the Fleditebos site . . . . .	127
7.3	Maximum surface conductance and actual conductance, with all reduction functions set to 1 and using the maximum total $L_{AI}$ . . . . .	127
7.4	$t$ -test values, testing the Null hypothesis that the independent variable does not contribute to predicting the surface conductance . . . . .	129
7.5	Correlation coefficient of the surface conductance for each site . . . . .	130
7.6	Optimization results of surface conductance for different seasons for all years measured at the pine forest . . . . .	138
7.7	Roughness characteristics and eddy-decay coefficient for the undergrowth of the pine forest and of the poplar forest . . . . .	141
7.8	Optimized maximum surface conductance and stomatal conductance functions for the trees and/or undergrowth at the Fleditebos and Loobos sites . . . . .	142
7.9	Evaluation of the dual source model evaporation results for the pine forest . . . . .	146
8.1	Average values for $kB^{-1}$ for four sites . . . . .	159
8.2	The ratio $\bar{E}/\bar{P}$ and the average evaporation rate $\bar{E}$ at the pine forest .	161
8.3	Regression results ( $E_{meas} = x_0 + aE_{PM}$ ) using roughness length of momentum and of heat . . . . .	164
8.4	Water storage capacity applying the analysis as outlined by Leyton et al. (1967) . . . . .	165

---

8.5	Water storage capacity on an areal basis, average measured evaporation and average precipitation rate . . . . .	168
8.6	Dependency of the storage capacity on $E$ , $H$ , $A$ , $T_a$ , $D_e$ , $u$ and $u_*$ expressed as $R^2$ . . . . .	170
8.7	Interception parameters and measured and modelled interception loss for the oak forest . . . . .	172
A.1	Stemflow parameters assuming a linear relationship with precipitation	189
B.1	Weight fractions of sand, silt and clay and densities at the Bankenbos site . . . . .	192
B.2	Weight fractions of sand, silt and clay and densities at the Fleditebos site. . . . .	192
B.3	Weight fractions of sand, silt and clay and densities at the Kampina site	192
B.4	Weight fractions of sand, silt and clay and densities at the Loobos site	192
D.1	Constants to calculate stem volume, density of fresh and dry wood and biomass of branches and leaves as percentage of stem biomass for different species. . . . .	202
D.2	Parameters for the allometric relations between the dry biomass of leaves, branches and stems for Scots pine. . . . .	203
D.3	Parameters for the allometric relations between the dry biomass of leaves, branches and stems for beech. . . . .	203
E.1	Soil water content for different soil water pressures at different soil depths . . . . .	205
UK.1	Vegetation characteristics at the sites . . . . .	213
NL.1	Vegetatiekenmerken op de verschillende locaties . . . . .	223
