## Contents

### Chapter 1
**General Introduction**

1.1 Metal (hyper)tolerance and hyperaccumulation
1.2 Zn and Cd hyperaccumulation in *N. caerulescens* and *A. halleri*
1.3 Heavy metal hypertolerance in non-hyperaccumulating metallophytes
1.4 Outline of this thesis

### Chapter 2
Expression of *HMA4* cDNAs under *HMA4* promoters from the zinc hyperaccumulator *Noccaea caerulescens* does not reverse the zinc-deficiency phenotype of the *Arabidopsis thaliana hma2hma4* double mutant
Supporting Information

### Chapter 3
Cd hypertolerance co-segregates with enhanced expression of an *HMA2*-like gene in intra-specific crosses between metallicolous and non-metallicolous *Silene paradoxa* L. and *Silene vulgaris* (Moench) Garcke
Supporting Information

### Chapter 4
Copper hypertolerance is associated with combined over-expression of the genes encoding the Cu-transporting ATPase, *HMA5*, and the type-2 metallothionein, *MT2b*, in cupricolous populations of *Silene vulgaris* and *S. paradoxa*
Supporting Information

### Chapter 5
General Discussion

### Chapter 6
Summary (in English)
Samenvatting (in Dutch)
