4 Comparison of Mediterranean and North Atlantic populations using DEB models

4.1 Introduction ................................................................. 70
4.2 Methods ................................................................. 73
  4.2.1 The static approach - Analyzing the “snapshots” of size and physiological condition of individuals from the two populations ........................................... 73
  4.2.2 The dynamic approach - Development and applications of the Dynamic Energy Budget (DEB) model ................................................................. 75
4.3 Results ................................................................. 83
  4.3.1 Analyzing the “snapshots” of the size and physiology of individuals from the Mediterranean and North Atlantic populations ......................................... 83
  4.3.2 DEB model .......................................................... 90
  4.3.3 Simulating biphasic growth with a change in food availability ........................................ 97
  4.3.4 Posthatchling growth ........................................ 98
4.4 Discussion ............................................................. 100
  4.4.1 Influence of the environment on the loggerhead turtles ........................................ 101
  4.4.2 Influence of physiology on the loggerhead turtles ........................................ 105
  4.4.3 Interactions of physiology and the environment ........................................ 113
4.5 Conclusion ............................................................ 116

5 Effects of environmental change and plastic ingestion on the energy budget of loggerheads

5.1 Introduction ............................................................. 120
5.2 Methods ................................................................. 122
  5.2.1 Effect of the environmental characteristics (temperature and food availability) on growth, maturation, and reproduction ........................................ 122
  5.2.2 Anthropogenic marine debris .................................. 126
5.3 Results ................................................................. 129
  5.3.1 Environmental characteristics (temperature and food availability) ........................................ 129
  5.3.2 Ingestion of non-digestible anthropogenic marine debris ........................................ 136
5.4 Discussion ............................................................. 138
  5.4.1 Is the energy budget realistic? .................................. 138
  5.4.2 Effects of the environment (food density and temperature) on growth, maturation, and reproduction of loggerhead turtles ........................................ 141
  5.4.3 Anthropogenic pressure: plastic and other non-digestible marine debris .................. 144
5.5 Conclusion ............................................................ 146
