List of figures

page

Figure 2.1: Principal components of the radiative forcing. 18

Figure 2.2: Atmospheric concentrations of important long-lived greenhouse gases 19

Figure 2.3: The global carbon cycle for the 1990^{s}. 22

Figure 2.4: Extent and location of global mires and peatlands. 23

Figure 2.5: Peatland areas and their greenhouse gas balance. 24

Figure 2.6: Schematic comparison of flux directions and relative magnitudes of net CO_2, CH_4 and N_2O fluxes in peatlands. 25

Figure 2.7: Current distribution of peat soils in the western Netherlands. 26

Figure 2.8: Schematic of the continuous land subsidence and sea level rise in the Netherlands. 27

Figure 2.9: Overview of a typical peat meadow area. 27

Figure 2.10: Example of an enclosure for flux chamber measurements. 29

Figure 2.11: Eddy covariance system with ultrasonic anemometer and gas analyser. 30

Figure 3.1: Current distribution of peat soils in the western part of the Netherlands. 46

Figure 3.2: Power-spectra of *w*, T and CO_2-concentration and co-spectra of *w'T'* and *w'CO₂'* for 10 Hz eddy covariance data. 54

Figure 3.3: Diurnal pattern of energy balance components net radiation, latent heat, sensible heat and ground heat flux and CO_2 flux. 54

Figure 3.4: Energy balance closure for daytime periods during the spring of 2005. 55

Figure 3.5: Daily NEE, GEP, R_{eco} and cumulative NEE over 2004, 2005, and 2006. 56

Figure 3.6: Relation between soil temperature and respiration. 57

Figure 3.7: Measured CH_4 fluxes at the Horstermeer site over 2004 to 2006. 59

Figure 3.8: Modelled daily CH_4 fluxes over 2005. 60

Figure 4.1: Schematic overview of the integrated cavity output analysis (ICOS) technique used in the FMA. 72

Figure 4.2: Time series of CH_4 concentration measurements with 10Hz sampling rate and the Allan variance plot for these data. 74

Figure 4.3: Results of the laboratory experiment on the effect of T_{cell} and P_{cell} on CH_4 concentration measurements. 76

page

Figure 4.4: Schematic overview of the combined eddy covariance field set-up for CH_4, CO_2 and water vapour. 77

Figure 4.5: Averaged and normalised time series of CH_4 concentration data showing the instrument response with 20Hz sampling rate. 78

Figure 4.6: Results of the spectral analyses of the FMA eddy covariance set-up for two moderately turbulent days. 79

Figure 4.7: Results of the analyses of the effect of low turbulence on nightly CH_4 fluxes. 83

Figure 4.8: CH_4 flux and CO_2 flux (NEE) data series over a two week period in the summer of 2006. 84

Figure 4.9: Hourly CH_4 flux data at July 10 and October 3 (both 2006) plotted in combination with flux chamber data from various land elements in the footprint of the eddy covariance tower. 85

Figure 4.10: Time series of CH_4 fluxes for a one day period: half hourly averages of 10Hz eddy covariance and simulated 1Hz eddy covariance, disjunct eddy covariance, and REA. 86

Figure 5.1: Overview of the Horstermeer site including all measurement locations 97

Figure 5.2: Satellite images of the south west part of the Horstermeerpolder with the average 99% footprint area of the eddy covariance tower and the land elements. 98

Figure 5.3A: Flux chamber data (CH_4 fluxes and R_{eco}), T_{s1} and WL_{soil} data at sites A, B, C, D and E between January 2004 and October 2007. 105

Figure 5.3B: Flux chamber data (CH_4 fluxes and R_{eco}), T_{s1} and WL_{soil} data at sites F, G, d1 and d2 between January 2006 and October 2007. 106

Figure 5.4: Temperature-corrected CH_4 fluxes plotted over WL_{soil} of the chamber data and eddy covariance data. 109

Figure 5.5: Seasonal averages of chamber measurements (CH_4 flux and R_{eco}), T_{s1} and WL_{soil} per group of sites. 110

Figure 5.6: Results from the measurements of dissolved CH_4 concentrations in the pore water over a soil profile at flux chamber sites A, C and E. 111

page

Figure 5.7: Comparison of surfaces fluxes observed with the soil CH_4 gradient method in the upper part of the soil profile and the chamber method. 112

Figure 5.8: Data series of CH_4 fluxes, NEE and LE measured with eddy covariance as well as continuous data series of SW_{in}, U, u_*, T_{s1} and WL_{soil} for the three measurement periods. 113

Figure 5.9: Results from the regression analyses of daytime data from the footprint analyses for the 2006 summer period. 116

Figure 5.10: Diurnal cycles of eddy covariance data (CH_4 fluxes, NEE, LE, ET), SW_{in}, T_{s1} and WL_{soil} per measurement period. 117

Figure 5.11: Schematic of the processes affecting CH_4 surface fluxes of four different physical soil profiles observed in the measurement area. 122

Figure 6.1: Overview of the Horstermeer peat area site with distribution of vegetation types and flux chamber sites. 137

Figure 6.2: Results of all measurements and analyses of soil variables for all vegetation types during the growing seasons of 2006 and 2007. 141

Figure 6.3: Results of all measurements and analyses of vegetation variables for all vegetation types during the growing seasons of 2006 and 2007. 142

Figure 6.4: Results of the measurements of CH_4 fluxes and R_{eco} for all vegetation types over the growing seasons of 2006 and 2007. 144

Figure 6.5: Overview of C-balance, ΔRM, ΔCS, ΔLB, R_{eco} and CH_4 flux for all vegetation types per growing season. 146

Figure 6.6: C-balance versus GHG balance of all vegetation types for both growing seasons. 148

Figure 6.7: Factor loadings of the soil and vegetation variables on the three important factor axes. 153

Figure 7.1: Results of the comparison between the different flux chamber set-ups 169
