CONTENT

Chapter 1
General Introduction 7

Chapter 2
Medial gastrocnemius muscle growth during adolescence is mediated by increased fascicle diameter rather than by longitudinal fascicle growth 21

Chapter 3
3D ultrasound imaging: fast and cost-effective morphometry of musculoskeletal tissue 45

Chapter 4
Foot flexibility confounds the assessment of triceps surae extensibility in children with spastic paresis during typical physical examinations 67

Chapter 5
Gastrocnemius medialis muscle geometry and extensibility in typically developing children and children with spastic paresis aged 6 to 13 years 85

Chapter 6
Comprehensive evaluation of gait, spasticity and muscle morphology: A case report of a child with spastic paresis treated with Botulinum NeuroToxin-A, serial casting and physiotherapy 111

Chapter 7
General summary and discussion 129
